Abstract (new)

The new invention is a combination processor, steamer and cooking device for foods and beverages. A powerful blade is used to chop, dice and puree. Water is heated to generate steam and is delivered into a centrally located passage-way. A cooking surface such as a traditional burner accompanies the feature set to provide a base heating and cooking element. The product as a whole clearly replaces the cumbersome procedure commonly used to make soups and sauces by combining the ability to steam then process then heat and mix ingredients into one product.
